Copy or pull MiniDatabase.scala, and minidatabase.csv.

Then test it (as a Scala Application--not a scalatest) providing the name of the minidatabase.csv file.

The homework will be due at 11:00 pm Sunday.

```
object Name {
  val rName4 = """^(\w+)\s+(\w.*)\s+(\w.*)\s\`"(\w+)\`"\"s*(\w+)\`"$""".r //Ex: Thomas E. P. "Tom"
  val rName3 = """^(\w+)\s+(\w.*)\s+(\w+)\`"$""".r //Ex: John J. Jinklehiemer-Smith
  val rName2 = """^(\w+)\s+(\w+)\`"$""".r //Ex: David Wade
  val rName1 = """^(\w+)\`"$""".r //Ex: Ed
  def apply(name: String): Name = {
    name match {
      //Tom Brady's name in CSV file is not in a regular format. Is that matter?
      case rName4(first, middle1, middle2, nick, last) => Name(first, middle1 + " " + middle2, last)
      case rName3(first, middle, last) => Name(first, middle, last)
      case rName2(first, last) => Name(first, "", last)
      case rName1(first) => Name(first, "", "")
      case _ => Name("", "", "")
    }
  }
}
```

2. Run as Scala Application

3. Output in console
